Java Programming – LAB 6

1. Create a string with value “Software Training and Development Centre” and do the following:
   a) Display its length.
   b) Check whether the string ends with “Centre” or not.
   c) Extract characters from position 9 to 16.
2. Write a program that would accept a line of text. Count the occurrence of each vowel in the text and display the count.
3. Write a program to display the number of words in a given sentence.
4. Accept the given text as input. Replace all occurrences of “you” by “they” and display the resultant string.
   “You are not happy because you are well. You are well because you are happy. You are not depressed because trouble has come, but trouble has come because you are depressed."
5. Write a program to arrange a given set of names in alphabetical order.
6. Write a program that reads a user’s username & password as input. Check the username & password valid as per the following conditions.
   a) Username should be minimum 8 characters long. It should not start with a number. White spaces are not allowed.
   b) Password should have at least one small case letter, one capital case letter & one number. It should be minimum 8 characters long.
7. Write a program to find if a given string is a palindrome or not using StringBuilder.
8. Accept a line of text. Find the reverse of each word and display the string.
9. Create an enum Size with four values: SMALL, MEDIUM, LARGE, and EXTRALARGE. Accept the pizza size from the user and display the selected size along with its ordinal value. Also, display all the available pizza sizes using the values() method.
