Java Programming– LAB

1. Write a program to print the following pattern where number of rows is given as input.

2. Write a program to find the transpose of a given matrix.
3. Create a class named **Car** with a default constructor which initializes the instance variable **model** with the value "Ford". Write a parametrized constructor also to initialize model. Write a **getModel()** method to print the value of model. Create two objects for the class using two constructors and invoke the getModel()method.
4. Write a class with a static method that returns the maximum value of three given integers. Write another class with main method and call the static method to print the maximum value for a set of integer values.
5. A class of n students take an annual examination in m subjects. Write a program to read the marks obtained by each student in various subjects and to compute and print the total marks obtained by each of them.
