Python Lab exercise- 1

1. Write a program to obtain three numbers and print their sum and average
2. Write a program to obtain the length and breadth of a rectangle and print its area
3. Write a program to obtain the height and weight of a person and calculate BMI (BMI = kg / m^2 , where kg is the weight and m is the height in metres)
4. Write a program to input a value in kilometres and convert it into miles
5. Write a program to input 2 values and swap them
   a. using an intermediate variable
   b. without intermediate variable
6. Write a program to input 3 numbers and swap them as: first number becomes the second, second becomes the third, third becomes the first number
7. Write a program to input 2 numbers and perform all arithmetic operations on them
8. Write a program to calculate in how many days a work will be completed by 3 persons A, B and C together. A, B and C takes x, y and z days respectively to do the job alone. The formula to calculate the number of days if they work together is xyz(xy+yz+zx) days where x, y and z are given as input to the program
9. Write a program that asks your height in centimetres and then converts your height to feet and inches (1 foot=12 inches, 1 inch=2.54 cm)
10. Write a program to read n and print n^2,n^3,n^4
11. Write a program to compute simple interest and compound interest
12. Write a program to input a number and print its first five multiples
13. Write a program to read the details like name,course and age of a student and print it in different lines with appropriate labels
