Python Lab exercise- 3 (Strings)

1. Write a program to input a string and print it in reverse
2. Write a program that asks for a username and password. Print “Login successful” if the password does not contain username and password is “cdac”
3. Write a program to check whether a string is a palindrome or not using string slice
4. Write a program that reads a line and prints the number of uppercase letters, lowercase letters, digits and spaces
5. Write a program that reads a line and a string and then display the number of occurrences if the string in the line
6. Write a program that inputs a line of text and then capitalizes the first letter of each word and forms a new string out of it
7. Write a program that reads a line of text and displays the longest word in that
8. Write a program to read a line of text and print the lowercase letters to uppercase letters and viceversa
9. Write a program that reads the email id and ensures that it belongs to domain “gmail.com”
10. Write a program that asks the user for a string and a character and then it print the locations of that character in the string
11. Write the program that inputs a string and creates a new string that doubles each character of the original string(For eg. if the user enters cdac, the output should be ccddaacc)
12. Write a program that reads a line of text and prints the count of words in a line
13. Write a program which replaces all the vowels in the string with “*”
14. Write a program that does the following
    a. prompt the user for a string
    b. extract all the digits from the string and sum the collected digits
    c. print the original string, the sum of the digits. If there are no digits print the original string and a message “ has no digits”
